

Polyclar VT

Other Names

Polyvinylpolypyrrolidone

Description

Polyclar VT is a grade of 100% PVPP with an average particle size of around 140 microns designed for addition to vessels, where faster settling is required.

Properties

- Allows majority of the product to be left behind with the lees at racking
- Larger particle size facilitates settling of the stabilizer
- A coarser grade optimized for addition to wine in tanks

Directions for use

A typical contact time of 3 to 10 days is required, although there are no adverse effects from leaving Polyclar in contact with the wine for longer periods. Filtration is still needed to produce a bright wine, but the amount of solids present should be much lower.

Hazard Warning

See MSDS

Dosage

Varies according to varietal

Packaging

50 lb drum
